
Where the invalidity forms arise (verifier reasons in `verifier.py`): **unsigned claim** in any channel → `no_clearance`; **floating approval** (signed, not bound to a payment) → `not_payload_bound`; **wrong payload** (amount or IBAN differs) → `payload_mismatch`; **expired** (window closed) → `expired`; **replayed** (nonce already used) → `replayed`; **unentitled signer** (KYC key signs a sanctions decision) → `signer_not_entitled`. Only `valid` should be executed.
